

## Horizon 6.7 HF Antenna

### Antenna Kit - Compact horizontal dipole

The **Horizon 6.7** antenna kit is a compact self supported dipole antenna specifically designed for "Limited-Small space" applications.

Designed for use with an auto-tuner, each element is fitted with an M5 stud and wing nut to enable easy feed wire connection. The central bracket has two U bolts to allow fitting to a 50mm OD pipe masthead.

Radiating elements are manufactured from telescoping 25mm & 22mm diameter "Drawn", not extruded aluminium. This makes them flexible and extremely resilient to high winds and bird landings.

The width of the assembled antenna is only 6.8 metres.

It is configured to operate in a frequency range of 3-54 MHz with the aid of an autotuner. (Subject to the tuning range of your tuner).

The dipole elements are two piece to reduce the shipping length to 202 centimetres.

It is easy to assemble and with a weight of only 3kgs it is extremely easy to erect.

### Horizon 6.7

# BU01097

- Requires an auto tuner
- Suits 3MHz - 54MHz - Tuner dependant
- Assembled length 6.8m
- Shipping length 2.02m
- Weight 3kg
